

1. Did your estimations reflect the actual effort?

The estimations seem to reflect the actual effort. That was put in.

2. Was your backlog well-prioritized?

By focusing on tasks that took relatively less time first and using a linear scale going from figuring out the login system to the database at the end, it was well-prioritized.

3. How did your simulated sprint align with your plan?

It aligned well with my plan as I was able to perform the EPIC's in the order I made them.

4. What insights did the burndown chart give about your team's capacity?

It showed that focusing on lower effort tasks at first lets us prepare for higher effort ones which have more story points related to them. Especially as a high priority task like logging in can be easy to make as compared to working with integrating the database.
